

Let V be a vector space, and let $\langle \cdot, \cdot \rangle : V \times V \rightarrow \mathbb{R}$ be an inner product on V . Define $\|\mathbf{x}\| := \sqrt{\langle \mathbf{x}, \mathbf{x} \rangle}$. Prove that $\|\cdot\|$ is a norm.

(Hint: To prove the triangle inequality holds, you may need the Cauchy-Schwartz inequality, $\langle \mathbf{x}, \mathbf{y} \rangle \leq \|\mathbf{x}\| \|\mathbf{y}\|$.)

① Absolutely homogeneous

$$\|\lambda \mathbf{x}\| = \sqrt{\langle \lambda \mathbf{x}, \lambda \mathbf{x} \rangle} = \sqrt{\lambda^2 \langle \mathbf{x}, \mathbf{x} \rangle} = |\lambda| \sqrt{\langle \mathbf{x}, \mathbf{x} \rangle} = |\lambda| \|\mathbf{x}\|$$

② positive definite

$$\text{for } \mathbf{x} \neq 0: \because \|\mathbf{x}\| = \sqrt{\langle \mathbf{x}, \mathbf{x} \rangle} \quad \langle \mathbf{x}, \mathbf{x} \rangle > 0 \quad \therefore \sqrt{\langle \mathbf{x}, \mathbf{x} \rangle} > 0$$

$$\text{if } \mathbf{x} = 0, \text{ clearly } \langle \mathbf{x}, \mathbf{x} \rangle = 0 \quad \therefore \sqrt{\langle \mathbf{x}, \mathbf{x} \rangle} = 0$$

$$\text{if } \sqrt{\langle \mathbf{x}, \mathbf{x} \rangle} = 0, \text{ which means } \langle \mathbf{x}, \mathbf{x} \rangle = 0, \text{ so } \mathbf{x} = 0$$

③ triangle inequality: $\|\mathbf{x} + \mathbf{y}\| \leq \|\mathbf{x}\| + \|\mathbf{y}\|$

$$\sqrt{\langle \mathbf{x} + \mathbf{y}, \mathbf{x} + \mathbf{y} \rangle} = \sqrt{\langle \mathbf{x}, \mathbf{x} \rangle + \langle \mathbf{x}, \mathbf{y} \rangle + \langle \mathbf{y}, \mathbf{x} \rangle + \langle \mathbf{y}, \mathbf{y} \rangle} = \sqrt{\langle \mathbf{x}, \mathbf{x} \rangle + 2\langle \mathbf{x}, \mathbf{y} \rangle + \langle \mathbf{y}, \mathbf{y} \rangle}$$

$$\therefore \langle \mathbf{x}, \mathbf{y} \rangle \leq \|\mathbf{x}\| \|\mathbf{y}\|$$

$$\therefore \sqrt{\langle \mathbf{x} + \mathbf{y}, \mathbf{x} + \mathbf{y} \rangle} \leq \sqrt{\|\mathbf{x}\|^2 + 2\|\mathbf{x}\|\|\mathbf{y}\| + \|\mathbf{y}\|^2} \leq \|\mathbf{x}\| + \|\mathbf{y}\|$$

$$\therefore \|\mathbf{x} + \mathbf{y}\| \leq \|\mathbf{x}\| + \|\mathbf{y}\|$$

1. Let $\mathbf{x}, \mathbf{a}, \mathbf{b} \in \mathbb{R}^n$. Prove that $\nabla_{\mathbf{x}}(\mathbf{x}^T \mathbf{a} \mathbf{b}^T \mathbf{x}) = \mathbf{a}^T \mathbf{x} \mathbf{b}^T + \mathbf{b}^T \mathbf{x} \mathbf{a}^T$.

2. Let $\mathbf{B} \in \mathbb{R}^{n \times n}$, $\mathbf{x} \in \mathbb{R}^n$. Prove that $\nabla_{\mathbf{x}}(\mathbf{x}^T \mathbf{B} \mathbf{x}) = \mathbf{x}^T (\mathbf{B} + \mathbf{B}^T)$.

$$1. f(\mathbf{x}) = \mathbf{x}^T \mathbf{a} \mathbf{b}^T \mathbf{x} \in \mathbb{R} \quad f: \mathbb{R}^n \rightarrow \mathbb{R}$$

$$\nabla_{\mathbf{x}}(f(\mathbf{x})) = \left[\frac{\partial f}{\partial x_1}, \frac{\partial f}{\partial x_2}, \dots, \frac{\partial f}{\partial x_n} \right] \in \mathbb{R}^{1 \times n}$$

$$\text{for } k \in \{1, \dots, n\}, \frac{\partial f}{\partial x_k} = \frac{\partial}{\partial x_k} \left[\left(\sum_{i=1}^n x_i b_i \right) \cdot \left(\sum_{i=1}^n x_i a_i \right) \right] = b_k \left(\sum_{i=1}^n x_i a_i \right) + a_k \left(\sum_{i=1}^n x_i b_i \right)$$

$$\begin{aligned} \therefore \nabla_{\mathbf{x}}(f(\mathbf{x})) &= \left[b_1 \left(\sum_{i=1}^n x_i a_i \right), b_2 \left(\sum_{i=1}^n x_i a_i \right), \dots, b_n \left(\sum_{i=1}^n x_i a_i \right) \right] + \left[a_1 \left(\sum_{i=1}^n x_i b_i \right), a_2 \left(\sum_{i=1}^n x_i b_i \right), \dots, a_n \left(\sum_{i=1}^n x_i b_i \right) \right] \\ &= [\mathbf{a}_1, \dots, \mathbf{a}_n] \begin{bmatrix} x_1 b_1 & x_1 b_2 & \dots & x_1 b_n \\ x_2 b_1 & \ddots & \ddots & \vdots \\ \vdots & \ddots & \ddots & \vdots \\ x_n b_1 & \ddots & \ddots & x_n b_n \end{bmatrix} + [\mathbf{b}_1, \dots, \mathbf{b}_n] \begin{bmatrix} x_1 a_1 & x_1 a_2 & \dots & x_1 a_n \\ x_2 a_1 & \ddots & \ddots & \vdots \\ \vdots & \ddots & \ddots & \vdots \\ x_n a_1 & \ddots & \ddots & x_n a_n \end{bmatrix} \\ &= \mathbf{a}^T \mathbf{x} \mathbf{b}^T + \mathbf{b}^T \mathbf{x} \mathbf{a}^T \end{aligned}$$

$$2. f(\mathbf{x}) = \mathbf{x}^T \mathbf{B} \mathbf{x} \in \mathbb{R} \quad f: \mathbb{R}^n \rightarrow \mathbb{R}$$

$$\nabla_{\mathbf{x}}(f(\mathbf{x})) = \left[\frac{\partial f}{\partial x_1}, \frac{\partial f}{\partial x_2}, \dots, \frac{\partial f}{\partial x_n} \right] \in \mathbb{R}^{1 \times n}$$

$$\text{for } k \in \{1, \dots, n\}, \frac{\partial f}{\partial x_k} = \frac{\partial}{\partial x_k} \left(\sum_{i=1}^n \sum_{j=1}^n x_i B_{ij} x_j \right) = \left(\sum_{j=1}^n B_{kj} x_j + x_k B_{kk} \right) + \sum_{j=1}^n x_j B_{jk} - x_k B_{kk}$$

$$= \sum_{j=1}^n x_j (B_{kj} + B_{jk})$$

$$\sum_{j=1}^n x_j (B_{kj} + B_{jk}) = [\mathbf{x}_1, \mathbf{x}_2, \dots, \mathbf{x}_n] \begin{bmatrix} B_{11} + B_{11} & B_{12} + B_{21} & \dots & B_{1n} + B_{n1} \\ B_{21} + B_{12} & \ddots & \ddots & \vdots \\ \vdots & \ddots & \ddots & \vdots \\ B_{n1} + B_{1n} & \ddots & \ddots & B_{nn} + B_{nn} \end{bmatrix} = \mathbf{x}^T (\mathbf{B} + \mathbf{B}^T)$$

Exercise 3

Properties of Symmetric Positive Definiteness

10 credits

Let \mathbf{A}, \mathbf{B} be symmetric positive definite matrices. ¹ Prove that for any $p, q > 0$ that $p\mathbf{A} + q\mathbf{B}$ is also symmetric and positive definite.

Since \mathbf{A} and \mathbf{B} are symmetric positive definite matrices, so the following holds.

① for any $x \neq \vec{0}$, $x^T \mathbf{A} x > 0$ and $x^T \mathbf{B} x > 0$

② $q\mathbf{A}$ and $p\mathbf{B}$ are symmetric clearly.

③ $\mathbf{A} + \mathbf{B}$ are symmetric (from lecture slide Linear Algebra I, page 15)

so $p\mathbf{A} + q\mathbf{B}$ is also symmetric

$$\because x^T (p\mathbf{A} + q\mathbf{B}) x = x^T (p\mathbf{A} x + q\mathbf{B} x) = x^T p\mathbf{A} x + x^T q\mathbf{B} x$$

$$\text{since } q\mathbf{B} \text{ is scalar so } x^T (p\mathbf{A} + q\mathbf{B}) x = p \cdot x^T \mathbf{A} x + q \cdot x^T \mathbf{B} x$$

$$\because p, q > 0, x^T \mathbf{A} x > 0, x^T \mathbf{B} x > 0 \text{ so } p \cdot x^T \mathbf{A} x + q \cdot x^T \mathbf{B} x > 0$$

\therefore it is positive definite

$\therefore p\mathbf{A} + q\mathbf{B}$ is symmetric positive definite matrices.

Exercise 4 General Linear Regression with Regularisation (10+10+10+10+10 credits)

Let $\mathbf{A} \in \mathbb{R}^{N \times N}, \mathbf{B} \in \mathbb{R}^{D \times D}$ be symmetric, positive definite matrices. From the lectures, we can use symmetric positive definite matrices to define a corresponding inner product, as shown below. From the previous question, we can also define a norm using the inner products.

1. Find the gradient $\nabla_{\theta} \mathcal{L}(\theta, c)$. $\mathcal{L}_{\mathbf{A}, \mathbf{B}, \mathbf{y}, \mathbf{X}}(\theta, c) = \|\mathbf{y} - \mathbf{X}\theta - \mathbf{c}\|_{\mathbf{A}}^2 + \|\theta\|_{\mathbf{B}}^2 + \|c\|_{\mathbf{B}}^2$

$$\mathcal{L}(\theta, c) = \|\mathbf{y} - \mathbf{X}\theta - \mathbf{c}\|_{\mathbf{A}}^2 + \|\theta\|_{\mathbf{B}}^2 + \|c\|_{\mathbf{B}}^2 = (\mathbf{y} - \mathbf{X}\theta - \mathbf{c})^T \mathbf{A} (\mathbf{y} - \mathbf{X}\theta - \mathbf{c}) + \theta^T \mathbf{B} \theta + \|c\|_{\mathbf{B}}^2$$

$$\mathcal{L}(\theta, c) = (\mathbf{y}^T - \theta^T \mathbf{X}^T - \mathbf{c}^T) (\mathbf{A}\mathbf{y} - \mathbf{A}\mathbf{X}\theta - \mathbf{A}\mathbf{c}) + \theta^T \mathbf{B} \theta + \|c\|_{\mathbf{B}}^2$$

$$= [(\mathbf{y}^T - \mathbf{c}^T) - \theta^T \mathbf{X}^T] [(\mathbf{A}\mathbf{y} - \mathbf{A}\mathbf{c}) - \mathbf{A}\mathbf{X}\theta] + \theta^T \mathbf{B} \theta + \|c\|_{\mathbf{B}}^2$$

$$= (\mathbf{y}^T - \mathbf{c}^T)(\mathbf{A}\mathbf{y} - \mathbf{A}\mathbf{c}) - \theta^T \mathbf{X}^T (\mathbf{A}\mathbf{y} - \mathbf{A}\mathbf{c}) - (\mathbf{y}^T - \mathbf{c}^T) \mathbf{A}\mathbf{X}\theta + \theta^T \mathbf{X}^T \mathbf{A}\mathbf{X}\theta + \theta^T \mathbf{B} \theta + \|c\|_{\mathbf{B}}^2$$

$$\nabla_{\theta} \mathcal{L}(\theta, c) = \frac{d}{d\theta} \left[(\mathbf{y}^T - \mathbf{c}^T)(\mathbf{A}\mathbf{y} - \mathbf{A}\mathbf{c}) - \theta^T \mathbf{X}^T (\mathbf{A}\mathbf{y} - \mathbf{A}\mathbf{c}) - (\mathbf{y}^T - \mathbf{c}^T) \mathbf{A}\mathbf{X}\theta + \theta^T \mathbf{X}^T \mathbf{A}\mathbf{X}\theta + \theta^T \mathbf{B} \theta + \|c\|_{\mathbf{B}}^2 \right]$$

$$= \frac{d}{d\theta} [-\theta^T \mathbf{X}^T (\mathbf{A}\mathbf{y} - \mathbf{A}\mathbf{c})] + \frac{d}{d\theta} [-(\mathbf{y}^T - \mathbf{c}^T) \mathbf{A}\mathbf{X}\theta] + \frac{d}{d\theta} [\theta^T \mathbf{X}^T \mathbf{A}\mathbf{X}\theta] + \frac{d}{d\theta} (\theta^T \mathbf{B} \theta)$$

$$\therefore \frac{\partial \mathbf{X}^T \mathbf{a}}{\partial \mathbf{x}} = \mathbf{a}^T, \quad \frac{\partial \mathbf{a}^T \mathbf{x}}{\partial \mathbf{x}} = \mathbf{a}^T \quad (\text{from lecture slide: Vector calculus: page 27}),$$

$$\frac{\partial \mathbf{X}^T \mathbf{B} \mathbf{x}}{\partial \mathbf{x}} = \mathbf{x}^T (\mathbf{B} + \mathbf{B}^T) \quad (\text{already proved it in Q2.2})$$

$$\therefore \nabla_{\theta} \mathcal{L}(\theta, c) = -[\mathbf{X}^T (\mathbf{A}\mathbf{y} - \mathbf{A}\mathbf{c})]^T - (\mathbf{y}^T - \mathbf{c}^T) \mathbf{A}\mathbf{x} + \theta^T \mathbf{X}^T \mathbf{A}\mathbf{x} + \theta^T \mathbf{X}^T \mathbf{A}^T \mathbf{x} + \theta^T \mathbf{B} + \theta^T \mathbf{B}^T$$

$$= -\underline{\mathbf{y}^T \mathbf{A} \mathbf{x}} + \underline{\mathbf{c}^T \mathbf{A} \mathbf{x}} - \underline{\mathbf{y}^T \mathbf{A} \mathbf{x}} + \underline{\mathbf{c}^T \mathbf{A} \mathbf{x}} + \underline{\theta^T \mathbf{X}^T \mathbf{A} \mathbf{x}} + \underline{\theta^T \mathbf{X}^T \mathbf{A}^T \mathbf{x}} + \underline{\theta^T \mathbf{B}} + \underline{\theta^T \mathbf{B}^T}$$

$\therefore \mathbf{A}, \mathbf{B}$ are symmetric positive definite matrix, so $\mathbf{A} + \mathbf{A}^T = 2\mathbf{A}, \mathbf{B} + \mathbf{B}^T = 2\mathbf{B}$

$$\therefore \nabla_{\theta} \mathcal{L}(\theta, c) = -2\mathbf{y}^T \mathbf{A} \mathbf{x} + 2\mathbf{c}^T \mathbf{A} \mathbf{x} + 2\theta^T \mathbf{X}^T \mathbf{A} \mathbf{x} + 2\theta^T \mathbf{B} = 2(\theta^T \mathbf{X}^T + \mathbf{c}^T - \mathbf{y}^T) \mathbf{A} \mathbf{x} + 2\theta^T \mathbf{B}$$

$$\therefore \nabla_{\theta} \mathcal{L}(\theta, c) = 2(\theta^T \mathbf{X}^T + \mathbf{c}^T - \mathbf{y}^T) \mathbf{A} \mathbf{x} + 2\theta^T \mathbf{B}$$

2. Let $\nabla_{\theta} \mathcal{L}(\theta, c) = \mathbf{0}$, and solve for θ . If you need to invert a matrix to solve for θ , you should prove the inverse exists.

$$\begin{aligned}\nabla_{\theta} \mathcal{L}(\theta, c) &= 2(\theta^T X^T + c^T - y^T) A X + 2\theta^T B = \underline{2\theta^T X^T A X} + \underline{2c^T A X} - \underline{2y^T A X} + \underline{2\theta^T B} \\ &= \theta^T (2X^T A X + 2B) + 2c^T A X - 2y^T A X = 0 \\ \theta^T (X^T A X + B) &= (y^T - c^T) A X \\ (X^T A X + B^T) \theta &= X^T A^T (y - c) \\ \theta &= (X^T A X + B^T)^{-1} X^T A^T (y - c)\end{aligned}$$

3. Find the gradient $\nabla_c \mathcal{L}(\theta, c)$.

We now compute the gradient with respect to c . $\mathcal{L}_{A, B, y, X}(\theta, c) = \|y - X\theta - c\|_A^2 + \|\theta\|_B^2 + \|c\|_B^2$

$$\mathcal{L}(\theta, c) = \|y - X\theta - c\|_A^2 + \|\theta\|_B^2 + \|c\|_B^2 = (y - X\theta - c)^T A (y - X\theta - c) + \|\theta\|_B^2 + c^T A c$$

$$\mathcal{L}(\theta, c) = (y^T - \theta^T X^T - c^T) (A y - A X \theta - A c) + c^T A c + \|\theta\|_B^2$$

$$\begin{aligned}\mathcal{L}(\theta, c) &= [(y^T - \theta^T X^T) - c^T] [(A y - A X \theta) - A c] + c^T A c + \|\theta\|_B^2 \\ &= (y^T - \theta^T X^T) (A y - A X \theta) - c^T (A y - A X \theta) - (y^T - \theta^T X^T) A c + 2c^T A c + \|\theta\|_B^2\end{aligned}$$

$$\begin{aligned}\nabla_c \mathcal{L}(\theta, c) &= \frac{d}{dc} (-c^T (A y - A X \theta)) + \frac{d}{dc} ((\theta^T X^T - y^T) A c) + \frac{d}{dc} (2c^T A c) \\ &= (A X \theta - A y)^T + (\theta^T X^T - y^T) A + 2c^T A \\ &= \underline{\theta^T X^T A} - \underline{y^T A} + \underline{\theta^T X^T A} - \underline{y^T A} + 4c^T A \\ &= (2\theta^T X^T - 2y^T + 4c^T) A\end{aligned}$$

the statement of properties
is claimed at Q4.1

4. Let $\nabla_c \mathcal{L}(\theta) = \mathbf{0}$, and solve for c . If you need to invert a matrix to solve for c , you should prove the inverse exists.

$$\begin{aligned}\nabla_c \mathcal{L}(\theta, c) &= 2\theta^T X^T A - 2y^T A + 4c^T A = 0 \\ 4c^T A &= 2y^T A - 2\theta^T X^T A \\ c^T &= \frac{1}{2}(y^T A - \theta^T X^T A) A^{-1} \\ C^T &= \frac{1}{2}(y^T - \theta^T X^T) \\ C &= \frac{1}{2}(y - X\theta)\end{aligned}$$

the inverse of A exists because A is a symmetric positive definite matrix

And a positive definite matrix has the property:

a symmetric positive definite matrix is invertible.

5. Show that if we set $A = I$, $c = 0$, $B = \lambda I$, where $\lambda \in \mathbb{R}$, your answer for 4.2 agrees with the analytic solution for the standard least squares regression problem with L2 regularization, given by

$$\theta = (X^T X + \lambda I)^{-1} X^T y.$$

In 4.2, $\theta = (X^T A X + B^T)^{-1} X^T A^T (y - c)$ and $A = I$, $c = 0$, $B = \lambda I$

$$\theta = (X^T I X + \lambda I^T)^{-1} X^T I^T (y - 0) = (X^T X + \lambda I)^{-1} X^T y$$
